1. Introduction

1.1 Purpose

The purpose of this web app is to provide users with a convenient platform for exploring and making informed decisions about where to eat. The app allows users to search for restaurants and food establishments based on their location, view information about each establishment, read reviews from other users, and leave their own feedback. The app also provides nutritional information to help users make healthy choices, and live support to assist with any questions or issues. The app is designed to be accessible on both desktop and mobile devices, making it easy to use and accessible to a wide range of users. The ultimate goal is to help users discover new food options and make confident, informed decisions about where to eat.

1.2 Document Conventions

<Describe any standards or typographical conventions that were followed when writing this SRS, such as fonts or highlighting that have special significance. For example, state whether priorities for higher-level requirements are assumed to be inherited by detailed requirements, or whether every requirement statement is to have its own priority.>

1.3 Intended Audience and Reading Suggestions

Project team members: Students who are working on the project, including developers, designers, and testers.

Internal guide: The SRS will be reviewed and evaluated by the internal guide who is overseeing the project.

Peers: Other students in the class may also review the SRS to provide feedback and suggestions.

External guide: They will want to review the document to ensure that the product meets their needs and expectations.

Reading suggestions for the SRS document could include the following:

Review the document in its entirety to get a general understanding of the project and its requirements.

Focus on specific sections that are relevant to readers role on the project, such as the functional requirements or non-functional requirements.

Review the document periodically throughout the project to ensure that the requirements are being met and to make any necessary updates.

1.4 Product Scope

Location-based restaurant search: Users can search for restaurants and food establishments in their area.

Establishment information and reviews: Users can view information about each establishment, including details of the menu items. They can also read reviews from other users and leave their own feedback.

Nutritional information: The app provides general information on the nutritional content of food items to

help users make informed choices.

Live support: The app includes live support to assist users with any questions or doubts they may have regarding nutritional information.

Favorite places and "must-try" list: Users can save their favorite establishments and create a list of must-try restaurants.

1.5 References

<List any other documents or Web addresses to which this SRS refers. These may include user interface style guides, contracts, standards, system requirements specifications, use case documents, or a vision and scope document. Provide enough information so that the reader could access a copy of each reference, including title, author, version number, date, and source or location.>

2. Overall Description

2.1 Product Perspective

<Describe the context and origin of the product being specified in this SRS. For example, state whether this product is a follow-on member of a product family, a replacement for certain existingsystems, or a new, self-contained product. If the SRS defines a component of a larger system, relate the requirements of the larger system to the functionality of this software and identify interfaces between the two. A simple diagram that shows the major components of the overall system, subsystem interconnections, and external interfaces can be helpful.>

2.2 Product Functions

Restaurant search: users can search for food establishments based on their location, cuisine type, and other relevant criteria.

Establishment information: users can view basic information about each restaurant, such as the address and menu.

User reviews: users can read reviews and ratings from other users, and leave their own feedback and ratings.

Nutritional information: The app provides general information on the nutritional content of food items to help users make informed choices.

Live support: The app includes live support to assist users with any questions or doubts they may have regarding nutritional information.

Mobile accessibility: the app is designed to be accessible on both desktop and mobile devices, making it easy to use and accessible to a wide range of users.

User accounts: users can create an account to save their favorite restaurants, review history, and more.

Personalized recommendations: the app can use user data and preferences to provide personalized recommendations for restaurants and menu items.

Social sharing: users can share their experiences and recommendations with friends and followers on social media.

2.3 User Classes and Characteristics

Casual users: casual users are individuals who use the app occasionally to search for and review food establishments. Characteristics: infrequent users, less concerned about personalized recommendations, not interested in live support.

Regular users: regular users are individuals who use the app frequently and have an account to save their favorite restaurants, review history, and more. Characteristics: frequent users, interested in personalized recommendations, may use live support occasionally.

Health-conscious users: health-conscious users are individuals who use the app to find healthy food options and to access nutritional information. Characteristics: interested in nutritional information, interested in healthy options.

Foodies: foodies are individuals who use the app to discover new food options, read reviews, and leave their own feedback. Characteristics: passionate about food, interested in discovering new options, active in leaving reviews.

2.4 Operating Environment

Hardware platform: the app should be accessible on both desktop and mobile devices, including laptops, smartphones, and tablets.

Operating system: the app should be compatible with popular operating systems such as Windows, mac OS, iOS, and Android.

Browser compatibility: the app should be accessible via modern web browsers, such as Google Chrome, Mozilla Firefox, Apple Safari, and Microsoft Edge.

Other software components: the app may need to integrate with third-party software components such as mapping APIs, nutritional databases, and payment gateways to provide a complete and seamless user experience.

2.5 Design and Implementation Constraints

<Describe any items or issues that will limit the options available to the developers. These might include: corporate or regulatory policies; hardware limitations (timing requirements, memory requirements); interfaces to other applications; specific technologies, tools, and databases to be used; parallel operations; language requirements; communications protocols; security considerations; design conventions or programming standards (for example, if the customer's organization will be responsible for maintaining the delivered software).>

2.6 User Documentation

<List the user documentation components (such as user manuals, on-line help, and tutorials) that will be delivered along with the software. Identify any known user documentation delivery formats or standards.>

2.7 Assumptions and Dependencies

<List any assumed factors (as opposed to known facts) that could affect the requirements stated in the SRS. These could include third-party or commercial components that you plan to use, issues around the development or operating environment, or constraints. The project could be affected if these assumptions are incorrect, are not shared, or change. Also identify any dependencies the project has on external factors, such as software components that you intend to reuse from another project, unless they are already documented elsewhere (for example, in the vision and scope document or the project plan).>

3. External Interface Requirements

3.1 User Interfaces

<Describe the logical characteristics of each interface between the software product and the users. This may include sample screen images, any GUI standards or product family style guides that are to be followed, screen layout constraints, standard buttons and functions (e.g., help) that will appear on every screen, keyboard shortcuts, error message display standards, and so on. Define the software components for which a user interface is needed. Details of the user interface design should be documented in a separate user interface specification.>

3.2 Hardware Interfaces

<Describe the logical and physical characteristics of each interface between the software product and the hardware components of the system. This may include the supported device types, the nature of the data and control interactions between the software and the hardware, and communication protocols to be used.>

3.3 Software Interfaces

<Describe the connections between this product and other specific software components (name and version), including databases, operating systems, tools, libraries, and integrated commercial components. Identify the data items or messages coming into the system and going out and describe the purpose of each. Describe the services needed and the nature of communications. Refer to documents that describe detailed application programming interface protocols. Identify data that will be shared across software components. If the data sharing mechanism must be implemented in a specific way (for example, use of a global data area in a multitasking operating system), specify this as an implementation constraint.>

3.4 Communications Interfaces

<Describe the requirements associated with any communications functions required by this product, including e-mail, web browser, network server communications protocols, electronic forms, and so on. Define any pertinent message formatting. Identify any communication standards that will be used, such as FTP or HTTP. Specify any communication security or encryption issues, data transfer rates, and synchronization mechanisms.>

4. System Features

<This template illustrates organizing the functional requirements for the product by system features, the major services provided by the product. You may prefer to organize this section by use case, mode of operation, user class, object class, functional hierarchy, or combinations of these, whatever makes the most logical sense for your product.>

4.1 System Feature 1

<Don't really say "System Feature 1." State the feature name in just a few words.>

4.1.1 Description and Priority

<Provide a short description of the feature and indicate whether it is of High, Medium, or Low priority. You could also include specific priority component ratings, such as benefit, penalty, cost, and risk (each rated on a relative scale from a low of 1 to a high of 9).>

4.1.2 Stimulus/Response Sequences

<List the sequences of user actions and system responses that stimulate the behavior defined for this feature. These will correspond to the dialog elements associated with use cases.>

4.1.3 Functional Requirements

<Itemize the detailed functional requirements associated with this feature. These are the software capabilities that must be present in order for the user to carry out the services provided by the feature, or to execute the use case. Include how the product should respond to anticipated error conditions or invalid inputs. Requirements should be concise, complete, unambiguous, verifiable, and necessary. Use "TBD" as a placeholder to indicate when necessary information is not yet available.>

<Each requirement should be uniquely identified with a sequence number or a meaningful tag of some kind.>

REQ-1:

REQ-2:

4.2 System Feature 2 (and so on)

5. Other Nonfunctional Requirements

5.1 Performance Requirements

<If there are performance requirements for the product under various circumstances, state them here and explain their rationale, to help the developers understand the intent and make suitable design choices. Specify the timing relationships for real time systems. Make such requirements as specific as possible. You may need to state performance requirements for individual functional requirements or features.>

5.2 Safety Requirements

<Specify those requirements that are concerned with possible loss, damage, or harm that could result from the use of the product. Define any safeguards or actions that must be taken, as well as actions that must be prevented. Refer to any external policies or regulations that state safety issues that affect the product's design or use. Define any safety certifications that must be satisfied.>

5.3 Security Requirements

<Specify any requirements regarding security or privacy issues surrounding use of the product or protection of the data used or created by the product. Define any user identity authentication requirements. Refer to any external policies or regulations containing security issues that affect the product. Define any security or privacy certifications that must be satisfied.>

5.4 Software Quality Attributes

<Specify any additional quality characteristics for the product that will be important to either the customers or the developers. Some to consider are: adaptability, availability, correctness, flexibility, interoperability, maintainability, portability, reliability, reusability, robustness, testability, and usability. Write these to be specific, quantitative, and verifiable when possible. At the least, clarify the relative preferences for various attributes, such as ease of use over ease of learning.>

5.5 Business Rules

<List any operating principles about the product, such as which individuals or roles can perform which functions under specific circumstances. These are not functional requirements in themselves, but they may imply certain functional requirements to enforce the rules.>

6. Other Requirements

<Define any other requirements not covered elsewhere in the SRS. This might include database requirements, internationalization requirements, legal requirements, reuse objectives for the project, and so on. Add any new sections that are pertinent to the project.>

Appendix A: Glossary

<Define all the terms necessary to properly interpret the SRS, including acronyms and abbreviations. You may wish to build a separate glossary that spans multiple projects or the entire organization, and just include terms specific to a single project in each SRS.>

Appendix B: Analysis Models

<Optionally, include any pertinent analysis models, such as data flow diagrams, class diagrams, state-transition diagrams, or entity-relationship diagrams.>

Appendix C: To Be Determined List

<Collect a numbered list of the TBD (to be determined) references that remain in the SRS so they can be tracked to closure.>
